

Minutes of Meeting (MoM)

Meeting Details:

- Date: 15-Oct-2025
- Venue/Mode: DGIS Office, Delhi (In Person)
- Attendees: Army Personnel, Turinton (Sumeet & Vasantha)
- Project: Situational Awareness Module of Army (SAMA)

Objective:

Discuss AI enablement opportunities for the SAMA application, data sources understanding, required database artifacts to proceed, expected analytics.

Context: SAMA Overview

- SAMA aggregates multi-level intelligence data to provide comprehensive situational awareness.
- Data aggregations are achieved through various API calls to respective intelligence body, capturing the required intelligence data.
- Data sources include:
 1. Tactical Intelligence: Feeds are provided by troops in contact into the system based on observation.
 2. Electronic Intelligence: Electronic signatures captured by RADAR.
 3. Battlefield Surveillance System: Activities are captured by sensors.
 4. Imagery Intelligence: Activities captured by satellite images.
 5. Electronic Situationship Report: Feeds are provided by battalions into the system based on observation.
- Data formats handled: text, images, videos, and annotated PDFs.
- Data originates from multiple echelons:
Battalion → Brigade → Division → Corps → Command → AHQ.
- Database: PostgreSQL (used by SAMA in the backend)

Current Data Handling Notes:

- Tactical Intelligence produces PDF reports registering all observations that are converted to Excel on demand.
- Electronic Situationship report primarily yields video/photo of the observation, comments are added by the forces to describe situation.
- Imagery Intelligence: Satellite images are annotated by the respective intel team and feed into SAMA along with the observations.

Data Repository and Scope

- The AI platform will integrate with the SAMA repository.
- Priority emphasis on enemy-related information.
- PostgreSQL tables of interest:
 1. e_sitrep_mst — Master SITREP data (enemy and internal activity).
 2. ecas_data — Electronic Correlation Analysis outputs.
 3. en_activity — Sensor-derived enemy activity data.
 4. imint_data — Satellite imagery intelligence.
 5. tactint — Tactical Intelligence (BSF-fed).
- Reference tables:
 1. incident_type references mst_estitrep_type.
 2. mst_estitrep_sub_type for subtype classification.
- Note: Majority of operational tables share a similar schema, populated from different sources/origins.

Deliverables Requested:

- DDL schema scripts (CREATE TABLE, CONSTRAINTS, INDEXES).
- Data Dictionary: table and column descriptions and artifacts.
- Clarification on fields to be used/required for synthetic data generation.

Expected AI Platform Capabilities:

- Dynamic/automatic generation of Situation Reports (SITREPs).
- Conversational follow-ups with citations, cross-references, and correlation.
- Detection of patterns and trends across time and geography of activities.
- Fingerprinting: Identification of Order of Battle (ORBAT).
- Predictive Analytics: Forecasting likely enemy courses of action.

Actions and Next Steps:

- **The Army:** Share the deliverables requested via email to sumeet.patil@turinton.com and vasantha.kumar@turinton.com
- **Turinton:** Demonstrate **any one** of the expected AI capabilities.
